*Denied the opportunity to become U.S. citizens through naturalization, Chinese were citizens of the United States through birth on U.S. soil or to U.S. citizens no matter where the birth occurred.

Questions and Activities

1. a. What percentage of the United States population was Chinese in 1880, two years before the Chinese Exclusion Act was passed? (Use formula 1A)

b. Calculate the percentage of Chinese in the U.S. population in 1990. The total U.S. population was 248,709,873 and the number of Chinese was 1,645,472.

c. Using the number of students in your classroom, calculate how many of them would represent the Chinese population in the United States (1) in 1880 and (2) in 1990. (Use formula 1B)
Would you say the Chinese population in the United States has increased a great deal? Moderately? Not much?

2. The thing that alarmed Americans in western states was not just the number of Chinese but the rate at which the number of Chinese seemed to be increasing.

Calculate the percent growth of the Chinese population between 1860 and 1870. (Use formula 2)

Between 1870 and 1880.

Between 1880 and 1890.

What happened between 1880 and 1890 to slow the growth?

3. Although Chinese immigrants made up only a very small part of the whole United States population, the Chinese were concentrated in certain areas. Californians, for example, saw many more Chinese immigrants than Americans living in states where few Chinese had settled. The following table shows the growth of the Chinese population in California over the three decades before the Exclusion Act.

<table>
<thead>
<tr>
<th>Year</th>

</tbody>
</table>

What percentage of the total California population was Chinese

In 1860?

In 1870?

In 1880?

Was there significant growth of the Chinese population in California compared to the growth of the whole population in California?

4. Compare the percentage of Chinese in the general population (#1) in 1880 with the percentage of Chinese in California (#3). Do either of these figures support the arguments made for exclusion in the readings?
FORMULAS

1A. The formula for calculating percentage of the Chinese in the U.S. population is

\[
\text{number of Chinese} \div \text{total U.S. population} = \% \text{ of Chinese in general population}
\]

*Example:* \[
\frac{105,465}{50,155,783} = \% \text{ of Chinese in U.S. population in 1880}
\]

1B. To figure what number of people in your class represents the percent of Chinese in the total population of 1880 or 1990, multiply the total number of students by the percent of Chinese in the population and then divide by 100.

*Example:* If your class has 25 students and you want to find out how many students make up 10%, you would do this calculation:

\[
\frac{25 \times 10}{100} = 2.5 \text{ students}
\]

2. To find the percent growth of the Chinese population, you use this formula

\[
\frac{\text{population of later year} - \text{population of early year}}{\text{population of early year}} = \% \text{ growth}
\]

*Example:* To calculate the percentage growth of the Chinese population in the United States between 1860 and 1870, you would do the following calculation

\[
\frac{63,199 - 34,933}{34,933} = \text{the percent that the Chinese population grew}
\]
Answer Key:

1. .2%, .6%
2. 1860 to 1870 80% increase
   1870 to 1880 67% increase
   1880 to 1890 1% increase
3. 1860 - 9%
   1870 - 8.8%
   1880 - 8.7%
   The percent of Chinese in the population of California declined slightly.
4. Less than 1% in the total U.S. population and not more than 9% in the population of California.
